

BLOXYGEN Preservative

Protect fine finishes during storage

USER INSTRUCTIONS

Please read all instructions prior to use!

1. Always wear safety glasses.
2. Twist extension tube into spray tip.
3. Avoid splash by pointing extension tip into partially filled tin and spray towards the side of the container (see illustration).
4. Hold the lid closely above the container and capture the heavy preservative gases as the oxygen is forced out.
5. Spray enough Bloxygen to fill the container void twice. This averages about 2 full seconds for quarts size tins and a full 4 seconds for gallons size containers depending on the empty volume of your container.
6. Firmly close the lid immediately and seal in the protective gases. The heavy gasses will settle and protect the remaining finish until the container is opened again.
7. Store unused Bloxygen in cool, dry location away from any direct or indirect heat source.
8. Keep the Bloxygen container out of the reach of children.
9. Dispose of empty or partially empty Bloxygen containers in accordance with local disposal laws. Do not incinerate or puncture.

Consumption: is approximately 1 pressurized canister per 40 – 50 tins of 750ml Coelan coating depending on remaining quantity of coating.
